

Developmental biology

Developmental biology is the field of biology that studies the processes by which multicellular organisms grow and develop, controlled by their genes. Knowledge of normal developmental processes can aid in the understanding of developmental abnormalities and other conditions such as cancer.

Methylglyoxal couples metabolic and translational control of Notch signalling in mammalian neural stem cells

Gene regulation and metabolism co-ordinate self-renewal and differentiation of neural precursors (NPCs) in the developing brain. Here the authors show that methylglyoxal, a glycolytic intermediate metabolite,... [show more](#)

Using proteolysis-targeting chimera technology to reduce navitoclax platelet toxicity and improve its senolytic activity

Senolytics have the potential to extend healthspan by selectively killing senescent cells (SCs), but senolytics that target Bcl-xl... [show more](#)

Ptch2/Gas1 and Ptch1/Boc differentially regulate

Hedgehog signalling in murine primordial germ cell migration

How co-receptors Gas1 and Boc interact with Ptch1/2 receptors and regulate Hh signalling is unclear. Here, the authors demonstrate that the spatiotemporal expression of Gas1 and Boc determines how Hh signalling... [show more](#)

HyperTRIBE uncovers increased MUSASHI-2 RNA binding activity and differential regulation in leukemic stem cells

The identification of mRNA targets for RNA binding proteins (RBP) in stem cells is difficult due to the limited number of available cells. Here, as a proof-of-principle, the authors adapt the HyperTRIBE method to... [show more](#)
